Consider the derivative of $f(x) = \sin(x)$.

$$\frac{d}{dx}\{\sin(x)\} \stackrel{?}{=} \cos(x).$$

$$\frac{d}{dx} \{\sin x\} = \lim_{h \rightarrow 0} \frac{\sin(x+h) - \sin(x)}{h}$$

$$\frac{d}{dx} \{\sin x\} = \lim_{h \rightarrow 0} \frac{\sin(x+h) - \sin(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\sin(x) \cos(h) + \cos(x) \sin(h) - \sin(x)}{h}$$

$$\begin{aligned}\frac{d}{dx} \{\sin x\} &= \lim_{h \rightarrow 0} \frac{\sin(x+h) - \sin(x)}{h} \\&= \lim_{h \rightarrow 0} \frac{\sin(x) \cos(h) + \cos(x) \sin(h) - \sin(x)}{h} \\&= \lim_{h \rightarrow 0} \frac{\sin(x)(\cos(h) - 1)}{h} + \lim_{h \rightarrow 0} \frac{\cos(x) \sin(h)}{h}\end{aligned}$$

$$\frac{d}{dx} \{\sin x\} = \lim_{h \rightarrow 0} \frac{\sin(x+h) - \sin(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\sin(x) \cos(h) + \cos(x) \sin(h) - \sin(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\sin(x)(\cos(h) - 1)}{h} + \lim_{h \rightarrow 0} \frac{\cos(x) \sin(h)}{h}$$

$$= \sin(x) \lim_{h \rightarrow 0} \frac{\cos(0+h) - \cos(0)}{h} + \cos(x) \lim_{h \rightarrow 0} \frac{\sin(h)}{h}$$

$$\frac{d}{dx} \{\sin x\} = \lim_{h \rightarrow 0} \frac{\sin(x+h) - \sin(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\sin(x) \cos(h) + \cos(x) \sin(h) - \sin(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\sin(x)(\cos(h) - 1)}{h} + \lim_{h \rightarrow 0} \frac{\cos(x) \sin(h)}{h}$$

$$= \sin(x) \lim_{h \rightarrow 0} \frac{\cos(0+h) - \cos(0)}{h} + \cos(x) \lim_{h \rightarrow 0} \frac{\sin(h)}{h}$$

$$= \sin(x) \left. \frac{d}{dx} \{\cos(x)\} \right|_{x=0} + \cos(x) \lim_{h \rightarrow 0} \frac{\sin(h)}{h}$$

$$\begin{aligned}
\frac{d}{dx} \{\sin x\} &= \lim_{h \rightarrow 0} \frac{\sin(x+h) - \sin(x)}{h} \\
&= \lim_{h \rightarrow 0} \frac{\sin(x) \cos(h) + \cos(x) \sin(h) - \sin(x)}{h} \\
&= \lim_{h \rightarrow 0} \frac{\sin(x)(\cos(h) - 1)}{h} + \lim_{h \rightarrow 0} \frac{\cos(x) \sin(h)}{h} \\
&= \sin(x) \lim_{h \rightarrow 0} \frac{\cos(0+h) - \cos(0)}{h} + \cos(x) \lim_{h \rightarrow 0} \frac{\sin(h)}{h} \\
&= \sin(x) \frac{d}{dx} \{\cos(x)\} \Big|_{x=0} + \cos(x) \lim_{h \rightarrow 0} \frac{\sin(h)}{h} = \boxed{\cos(x) \lim_{h \rightarrow 0} \frac{\sin(h)}{h}}
\end{aligned}$$

since $\cos(x)$ has a horizontal tangent, and hence has derivative zero, at $x = 0$.

First, we investigate $\lim_{h \rightarrow 0} \frac{\sin h}{h}$ informally.

It seems $\sin h \approx h$ when $h \approx 0$, so $\lim_{h \rightarrow 0} \frac{\sin h}{h} \stackrel{?}{=} 1$.

We can prove this more formally using the Squeeze Theorem and more trigonometry. We will first prove that $\frac{\sin(h)}{h} \leq 1$ and then we will prove that $\frac{\sin(h)}{h} \geq \cos(h)$. Then we will apply the Squeeze Theorem.

Here is the proof that $\frac{\sin(h)}{h} \leq 1$.

$$\sin(h) < h$$

$$\sin(h) < h \text{ so } \boxed{\frac{\sin(h)}{h} < 1}$$

Now for the proof that $\frac{\sin(h)}{h} \geq \cos(h)$.

green area: $\frac{h}{2}$

Blue area:

green area: $\frac{h}{2}$

Blue area: $\frac{\tan h}{2}$

green area: $\frac{h}{2}$

$$\frac{h}{2} < \frac{\tan(h)h}{2}$$

Blue area: $\frac{\tan(h)h}{2}$

green area: $\frac{h}{2}$

$$\frac{h}{2} \leq \frac{\tan(h)}{2}$$

Blue area: $\frac{\tan h}{2}$

$$\cos(h) \leq \frac{\sin(h)}{h}$$

We are now ready for the Squeeze Theorem. We have

$$\cos h \leq \frac{\sin h}{h} \leq 1$$

We are now ready for the Squeeze Theorem. We have

$$\begin{array}{ccccc} \cos h & & \leq & & \frac{\sin h}{h} & & \leq & & 1 \\ \lim_{h \rightarrow 0} \cos h = 1 & & & & & & & & \lim_{h \rightarrow 0} 1 = 1 \end{array}$$

We are now ready for the Squeeze Theorem. We have

$$\begin{array}{ccccc} \cos h & \leq & \frac{\sin h}{h} & \leq & 1 \\ \lim_{h \rightarrow 0} \cos h = 1 & & & & \lim_{h \rightarrow 0} 1 = 1 \end{array}$$

By the Squeeze Theorem,

We are now ready for the Squeeze Theorem. We have

$$\begin{array}{ccccc} \cos h & & \leq & \frac{\sin h}{h} & \leq & 1 \\ \lim_{h \rightarrow 0} \cos h = 1 & & & & & \lim_{h \rightarrow 0} 1 = 1 \end{array}$$

By the Squeeze Theorem,

$$\lim_{h \rightarrow 0} \frac{\sin h}{h} = 1$$

DERIVATIVES OF SINE AND COSINE

From before,

$$\frac{d}{dx}\{\sin(x)\} = \cos(x) \cdot \lim_{h \rightarrow 0} \frac{\sin(h)}{h} =$$

DERIVATIVES OF SINE AND COSINE

From before,

$$\frac{d}{dx}\{\sin(x)\} = \cos(x) \cdot \lim_{h \rightarrow 0} \frac{\sin(h)}{h} = \cos(x)$$

DERIVATIVE OF COSINE

Now for the derivative of \cos . We already know the derivative of \sin , and it is easy to convert between \sin and \cos using trig identities.

$$\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$$

1. Let $f(x) = \frac{x \tan(x^2 + 7)}{15e^x}$. Use the **definition of the derivative** to find $f'(0)$.

2. Differentiate $(e^x + \cot x)(5x^6 - \csc x)$.

3. Let $h(x) = \begin{cases} \frac{\sin x}{x} & , \quad x < 0 \\ \frac{ax+b}{\cos x} & , \quad x \geq 0 \end{cases}$

Which values of a and b make $h(x)$ continuous at $x = 0$?

Let $f(x) = \frac{x \tan(x^2 + 7)}{15e^x}$. Use the definition of the derivative to find $f'(0)$.

Differentiate $(e^x + \cot x)(5x^6 - \csc x)$.

$$\text{Let } h(x) = \begin{cases} \frac{\sin x}{x} & , \quad x < 0 \\ \frac{ax+b}{\cos x} & , \quad x \geq 0 \end{cases}$$

Which values of a and b make $h(x)$ continuous at $x = 0$?

Practice and Review

$$f(x) = \begin{cases} x^2 \cos\left(\frac{1}{x}\right) & , \quad x \neq 0 \\ 0 & , \quad x = 0 \end{cases}$$

Is $f(x)$ differentiable at $x = 0$?

$$g(x) = \begin{cases} e^{\frac{\sin x}{x}} & , \quad x < 0 \\ (x - a)^2 & , \quad x \geq 0 \end{cases}$$

What value(s) of a makes $g(x)$ continuous at $x = 0$?

We don't have rules for differentiating $f(x)$ at $x = 0$, so we have to fall back on the definition of the derivative.

$$\begin{aligned} f'(0) &= \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{h^2 \cos\left(\frac{1}{h}\right) - 0}{h} \\ &= \lim_{h \rightarrow 0} h \cos\left(\frac{1}{h}\right) = 0 \end{aligned}$$

Since the limit exists, $f(x)$ is differentiable at 0.

By the definition of continuity, $g(x)$ is continuous at $x = 0$ if

$$\lim_{x \rightarrow 0} g(x) = g(0)$$

- ▶ $g(0) = (0 - a)^2 = a^2$
- ▶ $\lim_{x \rightarrow 0^-} g(x) = \lim_{x \rightarrow 0^-} e^{\frac{\sin x}{x}} = e^1 = e$
- ▶ $\lim_{x \rightarrow 0^+} g(x) = \lim_{x \rightarrow 0^+} (x - a)^2 = a^2$

In order for $g(x)$ to be continuous, we need $a^2 = e$. That is, $a = \sqrt{e}$ or $a = -\sqrt{e}$.

A ladder 3 meters long rests against a vertical wall. Let θ be the angle between the top of the ladder and the wall, measured in radians, and let y be the height of the top of the ladder. If the ladder slides away from the wall, how fast does y change with respect to θ ?

When is the top of the ladder sinking the fastest? The slowest?

A ladder 3 meters long rests against a vertical wall. Let θ be the angle between the top of the ladder and the wall, measured in radians, and let y be the height of the top of the ladder. If the ladder slides away from the wall, how fast does y change with respect to θ ?

When is the top of the ladder sinking the fastest? The slowest?

We want to find how fast y is changing with respect to θ , so we want $\frac{dy}{d\theta}$, or $y'(\theta)$. To calculate that, we need to find y as a function of θ . Note that the ladder forms a right triangle with the wall, and y is the side adjacent to θ , while 3 is the hypotenuse. So, $\cos(\theta) = \frac{y}{3}$, hence $y = 3 \cos(\theta)$. Now we differentiate, and see

$$\frac{dy}{d\theta} = -3 \sin(\theta)$$

To answer the other questions, note that θ never gets larger than $\pi/2$, since at that point the ladder is lying on the ground. When $0 \leq \theta \leq \pi/2$, the smaller θ gives the smaller rate of change (in absolute value); so the top of the ladder is sinking slowly at first, then faster and faster, fastest just as it hits the ground.

Suppose a point in the plane that is r centimetres from the origin, at an angle of θ ($0 \leq \theta \leq \frac{\pi}{2}$), is rotated $\pi/2$ radians. What is its new coordinate (x, y) ? If the point rotates at a constant rate of a radians per second, when is the x coordinate changing fastest and slowest with respect to θ ?

Suppose a point in the plane that is r centimetres from the origin, at an angle of θ ($0 \leq \theta \leq \frac{\pi}{2}$), is rotated $\pi/2$ radians. What is its new coordinate (x, y) ? If the point rotates at a constant rate of a radians per second, when is the x coordinate changing fastest and slowest with respect to θ ?

$$x = r \cos \left(\theta + \frac{\pi}{2} \right) = -r \sin(\theta)$$

and

$$y = r \sin \left(\theta + \frac{\pi}{2} \right) = r \cos(\theta)$$

To find how fast x is changing with respect to θ , we take $x'(\theta) = -r \cos(\theta)$. We see that when $\theta = 0$, x changes a lot when θ changes; and when $\theta = \pi/2$, x only changes a little when θ changes.
