

Basic Question

What function has derivative $f'(x)$?

Basic Question

What function has derivative $f(x)$?

If $F'(x) = f(x)$, we call $F(x)$ an **antiderivative** of $f(x)$.

Basic Question

What function has derivative $f(x)$?

If $F'(x) = f(x)$, we call $F(x)$ an **antiderivative** of $f(x)$.

Examples

$\frac{d}{dx}[x^2] = 2x$, so x^2 is an antiderivative of $2x$.

$\frac{d}{dx}[x^2 + 5] = 2x$, so $x^2 + 5$ is (also) an antiderivative of $2x$.

Basic Question

What function has derivative $f(x)$?

If $F'(x) = f(x)$, we call $F(x)$ an **antiderivative** of $f(x)$.

Examples

$\frac{d}{dx}[x^2] = 2x$, so x^2 is an antiderivative of $2x$.

$\frac{d}{dx}[x^2 + 5] = 2x$, so $x^2 + 5$ is (also) an antiderivative of $2x$.

What is the most general antiderivative of $2x$?

Basic Question

What function has derivative $f(x)$?

If $F'(x) = f(x)$, we call $F(x)$ an **antiderivative** of $f(x)$.

Examples

$\frac{d}{dx}[x^2] = 2x$, so x^2 is an antiderivative of $2x$.

$\frac{d}{dx}[x^2 + 5] = 2x$, so $x^2 + 5$ is (also) an antiderivative of $2x$.

What is the most general antiderivative of $2x$?

$x^2 + c$, where we understand c as some constant (a number not depending on x).

ANTIDERIVATIVES

Find the most general antiderivative for the following equations.

$$f(x) = 17$$

$$f(x) = m$$

where m is a constant.

ANTIDERIVATIVES

Find the most general antiderivative for the following equations.

$$f(x) = 17$$

$$17x + c$$

$$f(x) = m$$

where m is a constant.

$$mx + c$$

differentiation fact

$$\frac{d}{dx}[x^2] = 2x$$

 \implies

antidifferentiation fact

antideriv of $2x$:

$$x^2 + c$$

differentiation fact

$$\frac{d}{dx}[x^2] = 2x$$

 \implies

antidifferentiation fact

$$\text{antideriv of } 2x : \quad x^2 + c$$

antideriv of x :

differentiation fact

$$\frac{d}{dx}[x^2] = 2x$$

 \implies

antidifferentiation fact

$$\text{antideriv of } 2x : \quad x^2 + c$$

$$\text{antideriv of } x : \quad \frac{1}{2}x^2 + c$$

differentiation fact

$$\frac{d}{dx}[x^2] = 2x$$

 \implies

antidifferentiation fact

$$\text{antideriv of } 2x : \quad x^2 + c$$

$$\text{antideriv of } x : \quad \frac{1}{2}x^2 + c$$

$$\text{Check: } \frac{d}{dx} \left[\frac{1}{2}x^2 + c \right] =$$

differentiation fact

$$\frac{d}{dx}[x^2] = 2x$$

 \implies

antidifferentiation fact

$$\text{antideriv of } 2x : \quad x^2 + c$$

$$\text{antideriv of } x : \quad \frac{1}{2}x^2 + c$$

$$\text{Check: } \frac{d}{dx} \left[\frac{1}{2}x^2 + c \right] = x$$

differentiation fact

$$\frac{d}{dx}[x^2] = 2x$$

 \implies

antidifferentiation fact

$$\text{antideriv of } 2x : \quad x^2 + c$$

$$\text{antideriv of } x: \quad \frac{1}{2}x^2 + c$$

$$\text{Check: } \frac{d}{dx} \left[\frac{1}{2}x^2 + c \right] = x$$

$$\frac{d}{dx}[x^3] = 3x^2$$

 \implies

$$\frac{d}{dx}[x^4] = 4x^3$$

 \implies

$$\frac{d}{dx}[x^5] = 5x^4$$

 \implies antideriv of x^n :

differentiation fact

$$\frac{d}{dx}[x^2] = 2x$$

 \implies

antidifferentiation fact

$$\text{antideriv of } 2x : \quad x^2 + c$$

$$\text{antideriv of } x: \quad \frac{1}{2}x^2 + c$$

$$\text{Check: } \frac{d}{dx} \left[\frac{1}{2}x^2 + c \right] = x$$

$$\frac{d}{dx}[x^3] = 3x^2$$

 \implies

$$\text{antideriv of } 3x^2: \quad x^3 + c$$

$$\text{antideriv of } x^2: \quad \frac{1}{3}x^3 + c$$

$$\frac{d}{dx}[x^4] = 4x^3$$

 \implies

$$\text{antideriv of } 4x^3: \quad x^4 + c$$

$$\text{antideriv of } x^3: \quad \frac{1}{4}x^4 + c$$

$$\frac{d}{dx}[x^5] = 5x^4$$

 \implies

$$\text{antideriv of } 5x^4: \quad x^5 + c$$

$$\text{antideriv of } x^4: \quad \frac{1}{5}x^5 + c$$

$$\text{antideriv of } x^n: \quad \frac{1}{n+1}x^{n+1} + c$$

$$\text{Check: } \frac{d}{dx} \left[\frac{1}{n+1}x^{n+1} + c \right] = x^n$$

Power Rule for Antidifferentiation

The most general antiderivative of x^n is $\frac{1}{n+1}x^{n+1} + c$ if $n \neq -1$

$$\blacktriangleright \frac{d}{dx} [\quad] = x^5$$

$$\blacktriangleright \frac{d}{dx} [\quad] = x^3$$

$$\blacktriangleright \frac{d}{dx} [\quad] = \frac{1}{2}x^3$$

Power Rule for Antidifferentiation

The most general antiderivative of x^n is $\frac{1}{n+1}x^{n+1} + c$ if $n \neq -1$

$$\blacktriangleright \frac{d}{dx} [\quad] = 5x^2 - 15x + 3$$

$$\blacktriangleright \frac{d}{dx} [\quad] = 13 \left(5x^{14} - 3x^{3/7} + 52e^x \right)$$

Find the most general antiderivatives.

$$f(x) = \cos x$$

$$f(x) = \sin x$$

$$f(x) = \sec^2 x$$

$$f(x) = \frac{1}{1+x^2}$$

$$f(x) = \frac{1}{1+x^2+2x}$$

Find the most general antiderivatives.

$$f(x) = \cos x$$

$$\sin x + c$$

$$f(x) = \sin x$$

$$-\cos x + c$$

$$f(x) = \sec^2 x$$

$$\tan x + c$$

$$f(x) = \frac{1}{1+x^2}$$

$$\arctan x + c$$

$$f(x) = \frac{1}{1+x^2+2x}$$

$$\frac{-1}{x+1}$$

Find the most general antiderivatives.

$$f(x) = 17 \cos x + x^5$$

$$f(x) = \frac{23}{5 + 5x^2}$$

$$f(x) = \frac{23}{5 + 125x^2}$$

Find the most general antiderivatives.

$$f(x) = 17 \cos x + x^5$$

$$17 \sin x + \frac{1}{6}x^6 + c$$

$$f(x) = \frac{23}{5 + 5x^2}$$

$$\frac{23}{5} \arctan x + c$$

$$f(x) = \frac{23}{5 + 125x^2}$$

$$\frac{23}{25} \arctan(5x) + c$$

Find the most general antiderivatives.

$$f(x) = \frac{1}{x}, x > 0$$

$$f(x) = 5x^2 - 32x^5 - 17$$

$$f(x) = \csc x \cot x$$

$$f(x) = \frac{5}{\sqrt{1-x^2}} + 17$$

Find the most general antiderivatives.

$$f(x) = \frac{1}{x}, x > 0$$

$$\ln x + c$$

$$f(x) = 5x^2 - 32x^5 - 17$$

$$\frac{5}{3}x^3 - \frac{16}{3}x^6 - 17x + c$$

$$f(x) = \csc x \cot x$$

$$-\csc x + c$$

$$f(x) = \frac{5}{\sqrt{1-x^2}} + 17$$

$$5 \arcsin x + 17x + c$$

CHOOSE YOUR OWN ADVENTURE

Antiderivative of $\sin x \cos x$:

- A. $\cos x \sin x + c$
- B. $-\cos x \sin x + c$
- C. $\sin^2 x + c$
- D. $\frac{1}{2} \sin^2 x + c$
- E. $\frac{1}{2} \cos^2 x \sin^2 x + c$

CHOOSE YOUR OWN ADVENTURE

Antiderivative of $\sin x \cos x$:

- E. $s(t) = 5t + 5$

Find all functions $f(x)$ with $f(1) = 5$ and $f'(x) = e^{3x+5}$.

Find all functions $f(x)$ with $f(1) = 5$ and $f'(x) = e^{3x+5}$.

Antiderivative of e^{3x+5} is $\frac{1}{3}e^{3x+5} + c$. So we only need to solve for c .

$$5 = f(1) = \frac{1}{3}e^{3+5} + c$$

implies

$$c = 5 - \frac{e^8}{3}$$

So

$$f(x) = \frac{1}{3}e^{3x+5} + 5 - \frac{e^8}{3}$$

Let $Q(t)$ be the amount of a radioactive isotope in a sample. Suppose the sample is losing $50e^{-5t}$ mg per second to decay. If $Q(1) = 10e^{-5}$ mg, find the equation for the amount of the isotope at time t .

Let $Q(t)$ be the amount of a radioactive isotope in a sample. Suppose the sample is losing $50e^{-5t}$ mg per second to decay. If $Q(1) = 10e^{-5}$ mg, find the equation for the amount of the isotope at time t .

We have

$$\frac{dQ}{dt} = -50e^{-5t}$$

Note the negative, since our sample is getting smaller.

Then antidifferentiating, we find $Q(t) = 10e^{-5t} + c$ for some constant c .

Then since $Q(1) = 10e^{-5}$, we see $c = 0$.

$$Q(t) = 10e^{-5t}$$

Suppose $f'(t) = 2t + 7$. What is $f(10) - f(3)$?

Suppose $f'(t) = 2t + 7$. What is $f(10) - f(3)$?

From antidifferentiation, we have $f(t) = t^2 + 7t + c$. Then

$$f(10) - f(3) = [100 + 70 + c] - [9 + 21 + c] = 170 - 30 = 140$$
